Home

The Global Land Component in the framework of GMES Initial Operations (GIO) is earmarked as a component of the Land service to operate "a multi-purpose service component" that will provide a series bio-geophysical products on the status and evolution of land surface at global scale. Production and delivery of the parameters are to take place in a timely manner and are complemented by the constitution of long term time series.

Special images

Space and Time Syntheses (April - September 2013, combine start/duration/intensity/extension of FAPAR values) produced using GIO data to present draught in Slovenia.

SLOVENIA - Remote sensing information support
FAPAR anomalies(*) cluster classification
from 01/01/2013 to 11/10/2013

Go to product:

- ✓ - Choose Product -
 - Burnt Area (BA)
 - Dry Matter Productivity (DMP)
 - Fraction of Absorbed Photosynthetically Active Radiation (FAPAR)
 - Fraction of green Vegetation Cover (FCover)
 - Leaf Area Index (LAI)
 - Normalized Difference Vegetation Index (NDVI)
 - Vegetation Condition Index (VCI)
 - Vegetation Productivity Index (VPI)
 - Land Surface Temperature (LST)
 - Surface Albedo (SA)
 - Top Of Canopy Reflectances (TOC-r)
 - Soil Water Index (SWI)
 - Water Bodies (WB)**

World Water Day 2014 and the importance of Water Bodies products!

News published:

1 month 1 week ago

1. **Human wellbeing and economy** – water supply
2. **Human security** - flood and drought monitoring
3. **Essential Climate Variables** – lake area, river discharge (modeling, impacts, adaptation)
4. **Food security** – irrigation, rangeland management
5. **Human and animal health** – pollution, poisons, disease and vectors
6. **Biodiversity** – wetland, lacustrine and riverine ecosystems, invasive species and migratory corridors
7. **Coastline, lake, river boundary changes** – infrastructure planning, insurance, reference databases

1. Permanent water surfaces
2. Seasonal water surfaces (and dates)
3. Ephemeral water surfaces (and dates)
4. New water surfaces
5. *Never water surfaces*

Surface water detection method

1. Based on Hue/Saturation/Value colour model – rather than RGB
2. Sensor neutral – used on L5, L7, L8 and MODIS
3. Uses Google Earth Engine for processing
4. Uses tools built on top of **GEE** - for spectral library development, classification and validation
5. Uses a number of masks:

Cloud
Snow
Vegetation
Slope
Bare rock
Temperature masks

Surface water examples

1. Global land surface process monitoring at Landsat-class resolution is a reality, but we are working at the limits of the system...
2. high quality radiometry and calibration are needed; which also allows multi-platform/sensor analysis...
3. which leads to better inter and intra annual temporal sampling...
4. and thus **completely new products** and services that meet the needs of *many* end-users
